## MUR8100E, MUR880E

## MUR8100E is a Preferred Device

## SWITCHMODETM <br> Power Rectifiers

## Ultrafast "E" Series with High Reverse Energy Capability

... designed for use in switching power supplies, inverters and as free wheeling diodes, these state-of-the-art devices have the following features:

- 20 mjoules Avalanche Energy Guaranteed
- Excellent Protection Against Voltage Transients in Switching Inductive Load Circuits
- Ultrafast 75 Nanosecond Recovery Time
- $175^{\circ} \mathrm{C}$ Operating Junction Temperature
- Popular TO-220 Package
- Epoxy Meets UL94, $\mathrm{V}_{\mathrm{O}}$ @ $1 / 8^{\prime \prime}$
- Low Forward Voltage
- Low Leakage Current
- High Temperature Glass Passivated Junction
- Reverse Voltage to 1000 Volts

## Mechanical Characteristics:

- Case: Epoxy, Molded
- Weight: 1.9 grams (approximately)
- Finish: All External Surfaces Corrosion Resistant and Terminal Leads are Readily Solderable
- Lead Temperature for Soldering Purposes: $260^{\circ} \mathrm{C}$ Max. for 10 Seconds
- Shipped 50 units per plastic tube
- Marking: U880E, U8100E

## MAXIMUM RATINGS

Figure 3. Current Derating, Case

Figure 4. Current Derating, Ambient

Figure 5. Power Dissipation

Figure 6. Test Circuit
The unclamped inductive switching circuit shown in Figure 6. was used to demonstrate the controlled avalanche capability of the new "E" series Ultrafast rectifiers. A mercury switch was used instead of an electronic switch to simulate a noisy environment when the switch was being opened.

When $S_{1}$ is closed at $t_{0}$ the current in the inductor $\mathrm{I}_{\mathrm{L}}$ ramps up linearly; and energy is stored in the coil. At $\mathrm{t}_{1}$ the switch is opened and the voltage across the diode under test begins to rise rapidly, due to di/dt effects, when this induced voltage reaches the breakdown voltage of the diode, it is clamped at $B V_{\text {DUT }}$ and the diode begins to conduct the full load current which now starts to decay linearly through the diode, and goes to zero at $t_{2}$.

By solving the loop equation at the point in time when $S_{1}$ is opened; and calculating the energy that is transferred to the diode it can be shown that the total energy transferred is equal to the energy stored in the inductor plus a finite amount of energy from the $\mathrm{V}_{\mathrm{DD}}$ power supply while the diode is in

Figure 7. Current-Voltage Waveforms
breakdown (from $t_{1}$ to $t_{2}$ ) minus any losses due to finite component resistances. Assuming the component resistive elements are small Equation (1) approximates the total energy transferred to the diode. It can be seen from this equation that if the $\mathrm{V}_{\mathrm{DD}}$ voltage is low compared to the breakdown voltage of the device, the amount of energy contributed by the supply during breakdown is small and the total energy can be assumed to be nearly equal to the energy stored in the coil during the time when $S_{1}$ was closed, Equation (2).

The oscilloscope picture in Figure 8. , shows the MUR8100E in this test circuit conducting a peak current of one ampere at a breakdown voltage of 1300 volts, and using Equation (2) the energy absorbed by the MUR8100E is approximately 20 mjoules.

Although it is not recommended to design for this condition, the new "E" series provides added protection against those unforeseen transient viruses that can produce unexplained random failures in unfriendly environments.

EQUATION (1):
$\mathrm{W}_{\mathrm{AVAL}} \approx \frac{1}{2} \mathrm{LI}_{\mathrm{LPK}}^{2}\left(\frac{\mathrm{BV}_{\mathrm{DUT}}}{\mathrm{BV}_{\mathrm{DUT}} \mathrm{V}_{\mathrm{DD}}}\right)$

EQUATION (2):

$$
\mathrm{W}_{\mathrm{AVAL}} \approx \frac{1}{2} \mathrm{LI}_{\mathrm{LPK}}^{2}
$$

CHANNEL2:
L 0.5 AMPS/DIV.

CHANNEL 1:
$V_{\text {DUT }}$ 500 VOLTS/DIV.

TIME BASE: $20 \mu \mathrm{~s} / \mathrm{DIV}$.

#### Abstract

ON Semiconductor and  without further notice to any products rademarks of Semiconductor Components industries, LLC (SCILLC). SCILLC reserves the right to make changes , SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer.
